

What about Homosexuality and health?

SECTION 2

WHAT ARE THE MEDICAL CONSEQUENCES OF HOMOSEXUALITY?

Restaurants, airlines, public and private businesses have increasingly been adopting policies which are discriminatory toward a significant segment of Americans: those who smoke. Los Angeles has prohibited the use of certain kinds of fighter fluid. Paint manufacturers had to devise new formulas for their products, the use of lead having become illegal. Our highways have speed limits. Why all this limitation of our freedom? Why can't people do what they want when they want? In these cases, for one reason only: because we value human life and health, and have determined that certain behaviors and practices pose serious health risks, not only for individuals, but for society as a whole.

Does homosexuality pose any such health risks? Do the behaviors practiced by homosexuals, and the consequences of these, constitute a socially significant threat?

THE ANATOMICAL RISK OF ANAL SEX

In contrast to normal, monogamous heterosexual intercourse, homosexual behavior in all its forms is risky at best. Consider anal intercourse. Without any reference to disease, the insertion of the penis into another's rectum is inherently injurious from a purely anatomical perspective. The rectum consists of a highly absorbent, single-layered wall of columnar epithelial cells. It is far more fragile than the multilayered vaginal wall made up of squamous cells and thus a more flexible and protected organ. The rectum is subject to rupture and tearing under the physical force of penile thrusting or the practice of "fisting," which involves the insertion of the hand or arm into the rectum. Ongoing anal intercourse often leads to the breakdown of normal rectal functions due to trauma to the anal sphincter muscle.¹⁶ This is an activity that is risky, whether practiced in homosexual or heterosexual context. Thus, basic anatomical facts demonstrate that the lower intestinal track was never intended to be used as a sex organ. But if body design isn't a sufficient argument against anal intercourse, the tragic reality of AIDS ought to be conclusive.

AIDS AND ANAL SEX

Its physical structure also makes the rectum highly susceptible to the infiltration of disease. With a thin cellular wall, infectious organisms more easily penetrate into the blood stream. In addition, the tearing and rupturing which can take place during anal intercourse exposes the individual to infection by manifold serious and fatal diseases. Of these, AIDS is the most well-known and the most dangerous. As of the end of June 30, 1993, 315,590 cases of AIDS have been reported.¹⁸ Of these, 191,642 were homosexual and bisexual men.¹⁸ That

sod-om-y *n.* 1. Anal copulation of one male with another. 2. Anal or oral copulation with a member of the opposite sex.

3. Copulation with an animal. [Middle English *sodomie*, from Old French, from Sodome, Sodom, from Latin *Sodoma*,

“The rectum consists of a highly absorbent, single-layered wall of columnar epithelial cells. It is far more fragile than the multi-layered vaginal wall made up of squamous cells and thus a more flexible and protected organ....Ongoing anal intercourse often leads to the breakdown of normal rectal functions due to trauma to the anal sphincter muscle.... Thus, basic anatomical facts demonstrate that the lower intestinal track was never intended to be used as a sex organ. But if body design isn't a sufficient argument against anal intercourse, the tragic reality of AIDS ought to be conclusive....Its physical structure also makes the rectum highly susceptible to the infiltration of disease.”

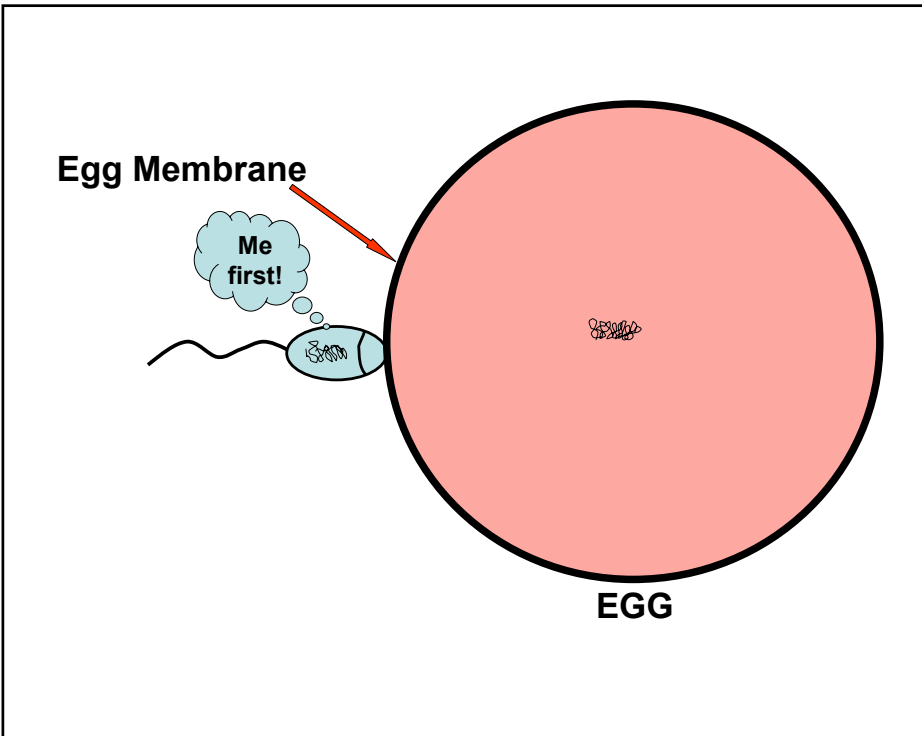

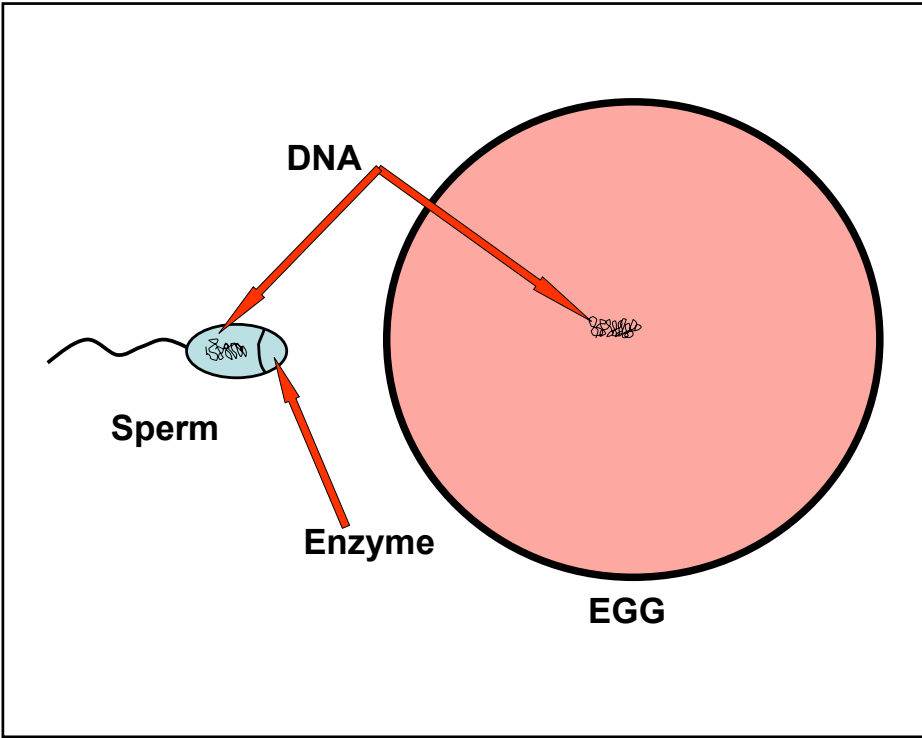

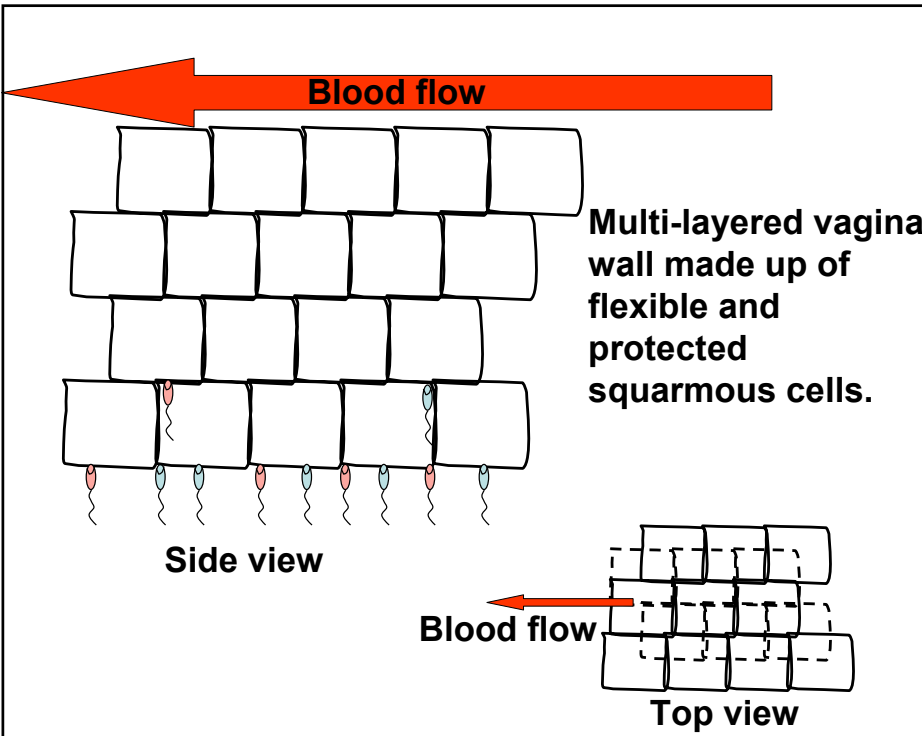

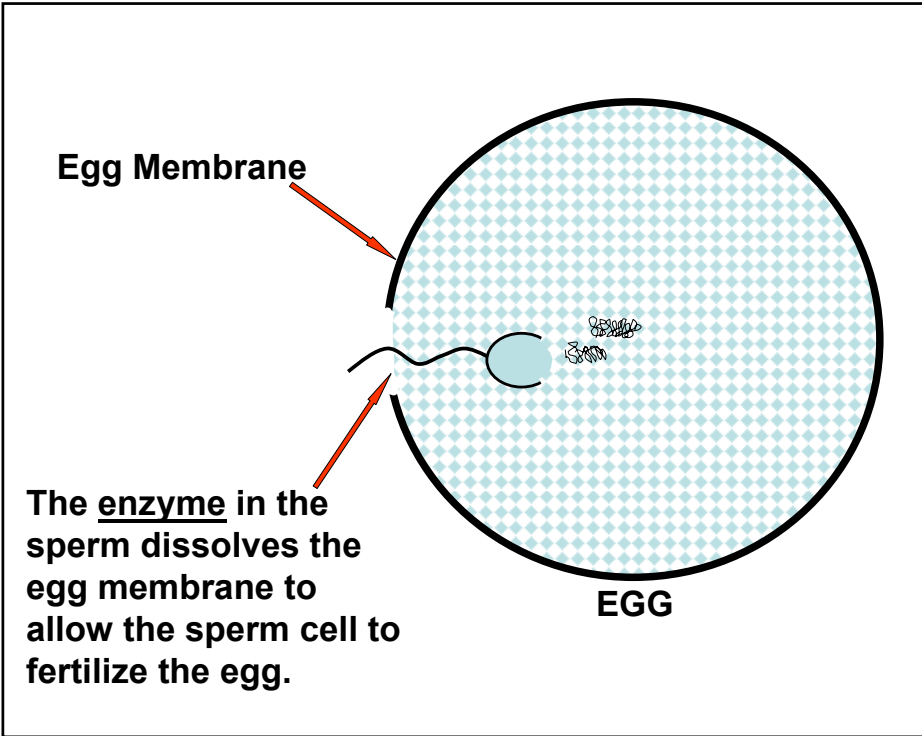

“Studies have also indicated that the body’s natural immune system is broken down by repeated exposure to sperm during anal (and oral) intercourse. The reason rests again in the difference between anal and vaginal membranes: sperm can penetrate the former but not the latter.”

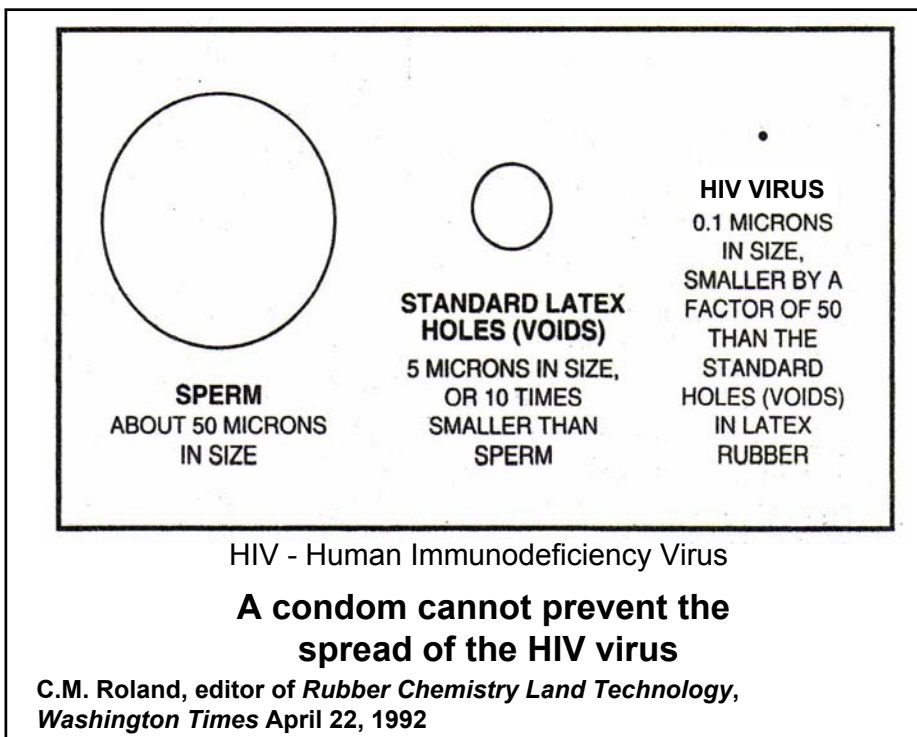

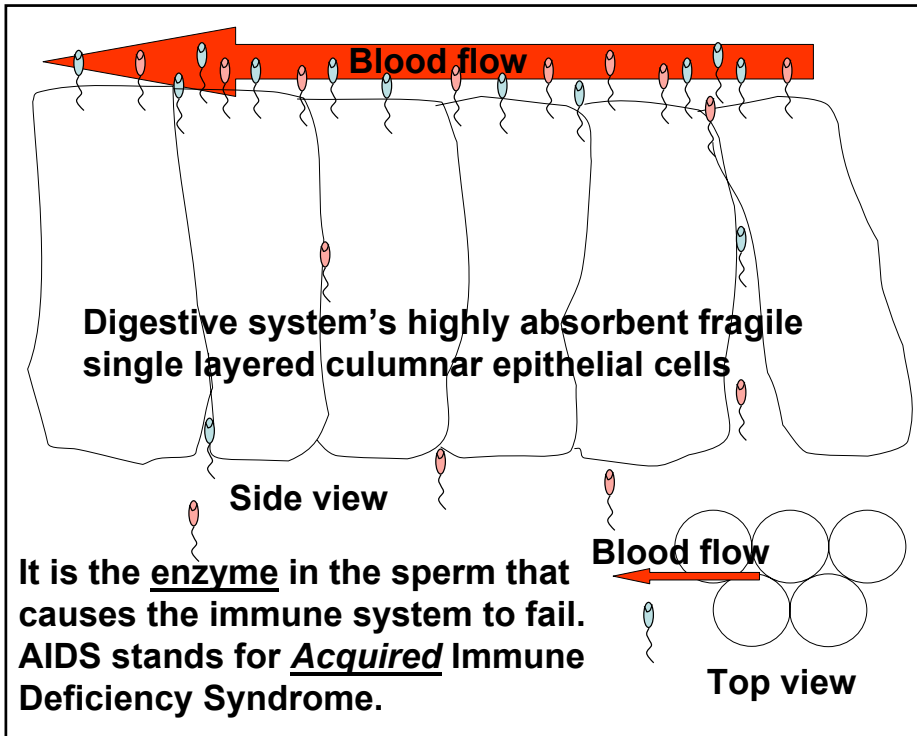

“While it is true that all of the diseases discussed above can be found among heterosexuals, statistics support the conclusion that homosexual, *precisely because of their sexual behavior*, are significantly more susceptible to infection, sickness and death.”

F.N. Judson *The American Journal of Epidemiology*, vol 112, p 836-43

“According to a recent study of 5,246 obituaries in 16 homosexual newspapers from coast to coast, the average age of men dying from AIDS is 39. The average age of homosexuals dying from all other causes is even more revealing: 41. Only one percent die of old age. Less than three percent of all homosexuals surveyed are over the age of 55.”

Paul Cameron, William I. Playfair, and Stephen William, *The Homosexual Lifespan*, Family Research Council, Inc. Washington, D.C. 1992

Day and night they go about it upon the walls thereof: mischief also and sorrow are in the midst of it. Wickedness is in the midst thereof: deceit and guile depart not from her streets. For it was not an enemy that reproached me; then I could have borne it: neither was it he that hated me that did magnify himself against me; then I would have hid myself from him: But it was thou, a man mine equal, my guide, and mine acquaintance. We took sweet counsel together, and walked unto the house of God in company. The words of his mouth were smoother than butter, but war was in his heart: his words were softer than oil, yet were they drawn swords... But thou, O God, shalt bring them down into the pit of destruction: bloody and deceitful men shall not live out half their days; but I will trust in thee.

Psalms 55:10-23

Skin Infection Breaks Out Among Gay Men in Los Angeles County

by GayHealth Staff, Tuesday, January 28, 2003

An outbreak of a drug resistant skin infection among gay men in Los Angeles County has health officials concerned, ...Staph typically breaks out in a cut or opening, however, these infections are originating in unbroken skin, and are attacking uncommon places including the butt, penis, scrotum, legs, hands and face.

The concern, according to Dr. Peter Ruane, an infectious disease specialist in Los Angeles, is that the disease could spread to "the community at large."

Large, painful skin infections started turning up early last fall among Los Angeles gay men, then appeared with increasing frequency.... . Because they still know so little about the extent of the outbreak, they cannot predict how many people it may eventually affect. The infection, which causes boils, deep abscesses and widespread surrounding inflammation, has proved impervious to common antibiotics.... But the infections in L.A. gay men -- the majority with well-controlled HIV/AIDS, but many others in good health -- took hold in unbroken skin. Federal figures show the percentage of staph specimens resistant to antibiotics increased from 2 percent in 1974 to 50 percent in 1997.

The L.A. investigation has found the local strain resistant to erythromycin and fluoroquinolones, such as Cipro and Levaquin. That limits the drug arsenal to Bactrim, rifampin, clindamycin, and the drug of last resort, vancomycin, which is administered intravenously. Some doctors use the new antibiotic Zyvox -- but with a single course costing \$1,500, they often have trouble persuading insurers to pay for it.

Skin infection spreads among gay men in L.A. : The emergence of the drug-resistant bacteria staph is the first such outbreak reported in that population
Los Angeles Times - January 27, 2003
Jane E. Allen, Times Staff Writer

... "It's an evolving story," said Ruane, who in September began noticing an increasing number of the aggressive staph infections in his gay patients. "The aggressiveness of this took us aback." ... They know that in cases where the infection spreads to the blood, it can prove fatal if antibiotics fail or it goes untreated.

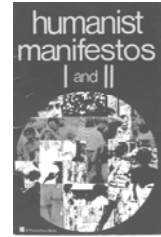

After comparing notes with several colleagues also seeing unusual skin infections in gay patients, Ruane said, "we felt we were looking at some form of outbreak." Ruane then notified county health officials.

That's when the federal Centers for Disease Control and Prevention reported the deaths of four children in Minnesota and North Dakota whose infections didn't respond to cephalosporins. Similar outbreaks, sometimes with fatalities, have been reported among intravenous drug abusers, athletes, prisoners, Native Americans and Eskimos, whose close living conditions make them likely to share personal items such as towels. Doctors treating it caution that it could also be contracted at health clubs, steam rooms and other warm, moist environments.

Conclusion and Recommendation

Homosexual lifestyle is a voluntary biological life-threatening public health hazard that is spreading a death and disease virus to people that cannot be stopped. We have seen the horrors of Africa and other countries to warn us. This is nothing short than voluntary bio-terrorism. How much money is the government willing to spend to try to change the Word of God for someone's preferred lifestyle? 2 to 4% of the population cannot drive 150 MPH on the highway for public health and safety, do not allow the homosexual behavior to continue their behavior for the same reason – it's killing us physically, and going to financially. Ultimately, this is another attempt for voluntary population reduction, as is with abortion. Get people to kill themselves while making the drug cartels rich. Stop it now.
